What it is (Rmarkdown/.Rmd)
In its essence, Rmarkdown is a
coding document containing text
that can be used to generate:

- Manuscripts
- Presentations
- Posters
- Books
- ...

whilst **maintaining reproducibility** of research.

It is *heavily reliant* on the LaTEX machinery.

What you need (Dependencies)

To be able to use the bare minimum of Rmarkdown, you need an installation F and RStudio (These are the basics). Advanced use of Rmarkdown is usually fuelled through LATEX and so you'll need installations of:

- LATEX (for generation of pdf documents)
- JabRef (for referencing)
- Perl (for glossaries)

What it is (Rmarkdown/.Rmd)

In its essence, Rmarkdown is a coding document containing text that can be used to generate:

- Manuscripts
- Presentations
- Posters
- Books
- ...

whilst **maintaining reproducibility** o research.

It is *heavily reliant* on the LaTEX machinery.

- Perl (for glossaries)

Why use Rmarkdown?

Using Rmarkdown for your research comes with a multitude of advantages:

- Entire workflow in one program (RStudio)
- Research and reports reproducible at the click of one button
- Combines R functionality and LaTEX formatting (if desired)
- Consistent formatting
- 5 Clear presentation of code
- **Dynamic documents** (you can generate various output document types)
- Applicable for almost all document types you may desire as an output (e.g. manuscripts, presentations, posters, etc.)

Rmarkdown Worflow

In the file menu of RStudio, click: File \rightarrow New File \rightarrow R Markdown

Write and edit the document and compile by knitting.

I cannot cover every aspect of Rmarkdown coding in one go. In case you bite, here are resources to help you along:

- Guides
 - An Introduction: https://rmarkdown.rstudio.com/lesson-1.html
 - The 'Definitive Guide': https://bookdown.org/yihui/rmarkdown/
- CheatSheets
 - Reference Guide: https://www.rstudio.com/wpcontent/uploads/2015/03/rmarkdown-reference.pdf
 - Proper CheatSheet: https://www.rstudio.com/wpcontent/uploads/2016/03/rmarkdown-cheatsheet-2.0.pd
- → I recommend learning Rmarkdown by inspecting working scripts (including the one used to produce this presentation). You can find some on my github: https://github.com/ErikKusch.

- 3 Code Chunks Here, you will implement R codes (Matlab and Python coding is supported as well) and run your analyses.

YAML Header

A non-exhaustive list of YAML specifiers:

YAML	Function
title	The heading of your work
subtitle	A subheading for your work
author	You and co-workers (if applicable)
date	Date of delivery or presentation
output	Whether to create html, pdf, or presentation
includes	Packages and auxiliary files
documentclass	LATEX document class (if applicable)
classoption	LATEX document option (if applicable)
fontsize	Base font size throughout document

University of Leipzig Excursions into Biostatistics 10 / 28

Text

Formatting can offset the inherently boring nature of plain text and can be done:

- Through base syntax
- Through LaTEX syntax

Text is *hard coded* but results and code outputs can be included through *soft-coding* via **in-line code**.

Text can also be supplied via **auxillary files** using the child syntax supplied by Rmarkdown. This is useful for big documents but makes cross-referencing very complicated.

Text

Formatting can offset the inherently boring nature of plain text and can be done:

Text is *hard coded* but results and code outputs can be included through *soft-coding* via **in-line code**.

Text can also be supplied via **auxillary files** using the child syntax supplied by Rmarkdown. This is useful for big documents but makes cross-referencing very complicated.

Code Chunks

R Code chunks are started with ``` {r} and ended with ```. Chunks are supplied with optional arguments within the {} brackets. A non-exhaustive list of **chunk options**:

Option	Function
name	A name for the chunk, these have to be individual
eval	TRUE if code in chunk should be executed
include	TRUE if chunk should be run but not included in final
	document
echo	TRUE if code will be displayed
tidy	TRUE if code should be displayed according to tidy
	formatting rules
cache	TRUE if cache for chunk is to be stored for faster
	compilation on repeated knitting

In-Line Code

In-line code can be used to display code output alongside plain text. This is done as follows:

```
# establish and R object to reference in-line
Answer <- 42
```

Then, you write `r Answer` and receive the output 42.

This is especially useful when wanting to generate reports that may be re-evaluated using different analyses or novel data sets as results may change.

University of Leipzig Excursions into Biostatistics 13 / 28

Figures and Rmarkdown

Using Rmarkdown for data visualisation is extremely useful:

- Figures are generated on each compilation (unless no cache is stored) thus always being up-to-date with the underlying data
- Sub figures are established automatically as long as sub captions are supplied
- Figures are registered automatically for the table of figures
- Figure placement on the page is fixed (no dragging around as in MS Word)
- No scaling artefacts
- Entire workflow can happen in just one document!

Rmarkdown can handle all plotting outputs of R coding including ggplot2 plots.

University of Leipzig Excursions into Biostatistics 14 / 28

Figures and Rmarkdown

Using Rmarkdown for data visualisation is extremely useful:

- Figures are generated on each compilation (unless no cache is stored) thus always being up-to-date with the underlying data
- Sub figures are established automatically as long as sub captions are supplied
- Figures are registered automatically for the table of figures
- Figure placement on the page is fixed (no dragging around as in MS Word)
- No scaling artefacts
- Entire workflow can happen in just one document!

Rmarkdown **can handle all plotting outputs of** R **coding including** ggplot2 plots.

University of Leipzig Excursions into Biostatistics 14 / 28

Setting Code Up

Basic options for coding chunks and kitting options should be defined at the beginning of the Rmarkdown document:

This chunk should usually be set to include = FALSE to run the code but not show any of it.

Text Formatting

Basic Rmarkdown formatting can be used to generate more lively text:

Formatting	Result
Plain text *italics* and _italics_ **bold** andbold superscript^2^ ~~strikethrough~~	Plain text italics and italics bold and bold superscript ² strikethrough

A line break in Rmakrdown can be achieved by ending a line with two spaces.

More advanced text formatting is possible via the LaTEX engine. An exhaustive guides for LaTEX formatting can be found here (this covers almost all matters LaTEX: http://www.rpi.edu/dept/arc/docs/latex/latex-intro.pdf.

University of Leipzig Excursions into Biostatistics 17 / 28

Text Formatting

Basic Rmarkdown formatting can be used to generate more lively text:

Formatting Plain text *italics* and _italics_ **bold** and _bold_ superscript^2^ ~~strikethrough~ Result Plain text italics and italics bold and bold superscript^2 strikethrough		
italics and _italics_ italics and italics **bold** andbold_ bold and bold superscript^2 superscript ²	Formatting	Result
	italics and _italics_ **bold** andbold_ superscript^2^	italics and italics bold and bold superscript ²

A line break in Rmakrdown can be achieved by ending a line with two spaces.

University of Leipzig Excursions into Biostatistics 17 / 28

Text Tables

Rmarkdown is capable of generating tables through plain text inputs:

```
Table Header | Second Header
----- | ------
Table Cell | Cell 2
Cell 3 | Cell 4
```

turns into:

Table Header	Second Header	
Table Cell	Cell 2	
Cell 3	Cell 4	

University of Leipzig Excursions into Biostatistics 18 / 28

Figures

Figures which aren't generated via R but present as files on the hard drive have to be included into the Rmarkdown document the LaTEX way.

This is done using the **includegraphics** command in the **graphicx** package for LATEX. The output of this command is sensitive to other environment specifiers such as floats (*centering*, *raggedright*, *etc.*).

A LATEX **figure environment** is useful for *including figures* which have been included this way *into the table of figures and make them available for cross-referencing.*

University of Leipzig Excursions into Biostatistics 19 / 28

kable Tables I

The kable functionality in Rmarkdown enables us to generate appealing Lagrangian Lagrang

Code chunks which generate kable tables need an additional argument:

```
results = 'asis'.
```

kable Tables II

Table 5: Short Description - Long Description

	First two columns		Last two columns	
	C1	C2	СЗ	C4
R1	1	6	11	16
R2	2	7	12	17
R3	3	8	13	18
R4	4	9	14	19
R5	5	10	15	20

It is obvious how this way of table generation **enables reproducible research** as this tables can be directly generated from data and analyses outputs.

R Functions

Complex data analysis and data visualisation often invokes **user-generated R functions**. These should be *presented alongside all other results and data*.

Rmarkdown enables this in a three-step process

- Write Function in a chunk with echo set to FALSE (preferably in preamble)
- 2. Call Function into action in another chunk where it is needed
- 3. Present Function using another chunk which is set to eval = FALSE by calling the chunk option ref.label='name', where name represent the name of the chunk established in step 1

R Functions

Complex data analysis and data visualisation often invokes **user-generated R functions**. These should be *presented alongside all other results and data*.

Rmarkdown enables this in a three-step process:

- 1. Write Function in a chunk with echo set to FALSE (preferably in preamble)

Cross-referencing is vital for manuscripts writing and easy to implement in Rmarkdown when run through LTFX:

Sections

- Index section by generating a label via the *label* command.
- Call section index via the ref command.

Figures

- Index figure via the label command in Lagrange environment of chunk option.
- Reference using the ref command.

Tables

- Index table via the *label* command in Latex environment or chunk option.
- Reference using the *ref* command.

Chunks

- Generate labelling automation using the *floatrow* package for LATEX.
- Reference using the ref command and name of the chunk in question.

Cross-referencing is vital for manuscripts writing and easy to implement in Rmarkdown when run through LTFX:

Sections

- Index section by generating a label via the *label* command.

Bibliographies and Glossaries

Including a bibliography or a glossary is a necessity in manuscript writing:

Bibliography

- Install JabRef
- Generate .bib bibliography file
- In YAML header or auxiliary .tex file included in YAML header, load LATEX package natbib
- Reference using the cite command
- Establish bibliography suing the bibliography command

Glossary

- Install Perl
- In YAML header or auxiliary .tex file included in YAML header, load LATEX package glossaries
- Establish glossary entries in .tex file or preamble to document file
- Establish glossary at desired location in document using the printglossary command
- Use glossary commands in text
- Compiling requires an extra step through your LATEX compiler for glossary to show u

Beamer is the LATEX way of generating presentation slides and comes with a few quirks:

- Strong limitations on layout (it is best to chose from pre-established styles)
- No animations possible
- Stiff and unwieldy positioning of items

These limitations often lead to headaches when generating the presentations but much cleaner looking presentations with consistent formatting.

LATEX column environment (used in Beamer presentations) do not allow for the evaluation of Rmarkdown syntax. This can be circumvented as by defining novel commands for the column environment instead of calling the default LATEX commands.

Beamer is the LATEX way of generating presentation slides and comes with a few quirks:
